

From Frozen Fingers to Wow

A teacher's guide for helping complete beginners discover AI's potential

Teacher Guide

30 class activities for complete beginners
exploring AI's potential

This guide gives teachers 30 classroom activities that begin with nervous first keystrokes and build toward polished, surprising products. The thread running through every activity is simple: students should not merely ask AI for answers. They should learn to direct it, question it, verify it, improve it, and transform its output into something useful.

Use a school-approved AI system and follow local policy. Students should avoid private information, names, grades, health details, addresses, passwords, and anything they would not want stored or reviewed. Treat AI output as a draft, not authority.

Quick Start

- Best fit: grades 6-12, higher education, adult education, or professional learning, with adaptation.
- Class rhythm: demonstrate briefly, let students try, compare outputs, revise prompts, and reflect.
- Teacher stance: praise curiosity, ask for evidence, and require students to explain final choices.
- Evidence of learning: prompt drafts, AI outputs, verification notes, revised products, and short reflections.

The 30-Activity Pathway

Stage	Activities	Main teacher move
Comfort	1-6	Lower fear, make first prompts feel safe, visible, and useful.
Prompt Craft	7-12	Show that prompts can be designed, compared, scored, and improved.
Judgment	13-18	Build verification, bias awareness, critique, and responsibility.
Creation	19-24	Turn AI output into artifacts, media plans, data stories, and proposals.
Wow Build	25-30	Chain tools into personalized coaches, websites, app ideas, and capstones.

Prompt Quality Rubric

Use this five-part rubric for prompt tournaments, peer review, quick grading, or student self-assessment. A strong prompt does not need to be long. It needs to tell the AI what success looks like.

Criterion	4 - Strong	2 - Developing	0 - Missing
Goal	Task and desired outcome are explicit.	Topic is present but purpose is fuzzy.	No clear task.
Audience	Reader, level, and tone are named.	Audience is implied.	No audience.
Context	Useful background and constraints are included.	Some context, but gaps remain.	AI must guess.
Format	Output structure is specific and usable.	Format is vague.	No format requested.
Quality check	Prompt asks for criteria, critique, or verification.	Some quality language.	No way to judge success.

Beginner Prompt Frame

Act as [role] **to help** [audience] **understand or create** [goal]. **Use** [context]. **Include** [requirements]. **Format as** [format]. **Before finalizing, check for** [quality criteria].

Classroom Norms

- Do not paste private information into AI systems.
- Do not trust a response because it sounds confident.
- Do not let AI replace your own thinking, taste, responsibility, or voice.
- Do use AI to ask better questions, generate options, explain complexity, critique drafts, and build products.

The Activities

Each activity can stand alone, but the sequence is designed to build confidence, craft, judgment, and creative ambition. The activities deliberately repeat a pattern students can internalize: prompt, inspect, revise, verify, make, and explain.

1. The First Safe Hello | Comfort

Time: 20-30 minutes **Core skill:** Starting a conversation with AI

Materials: School-approved AI tool, projector, student notes

Goal: Students experience AI as an interactive helper rather than a search box.

Classroom moves

- Ask each student to choose a harmless familiar topic: a sport, hobby, game, food, animal, book, or skill.
- Students type: "Explain [topic] to me like I am brand new, then ask me one question."
- They answer the AI question and ask one follow-up beginning with "Can you make that..."
- Pairs compare how their second prompt changed the response.

Wow extension: Have students ask the AI to explain the same topic in three levels: for a five-year-old, for a high school student, and for an expert.

Debrief: What changed when you answered the AI's question? What did the AI do well? Where did it still need you?

2. Tiny Prompt, Better Prompt | Comfort

Time: 30 minutes **Core skill:** Adding context, audience, and format

Materials: Shared board or document

Goal: Students see that prompting is a design skill, not magic wording.

Classroom moves

- Begin with a one-word prompt such as "volcanoes" or "homework" and show the weak result.
- As a class, add one improvement at a time: role, audience, goal, constraints, tone, and output format.
- Students repeat the ladder with their own topic and save each version.
- Pairs underline the sentence in their prompt that made the biggest difference.

Wow extension: Ask AI to turn the best prompt into a reusable template with blanks any student can fill in.

Debrief: Which details gave you more control? Which details were unnecessary?

3. AI as a Patient Tutor | Comfort

Time: 35-45 minutes **Core skill:** Learning through back-and-forth dialogue

Materials: Current class topic or review topic

Goal: Students practice asking for help without embarrassment and checking understanding.

Classroom moves

- Students choose one concept they find confusing from any class.
- They prompt: "Tutor me on [concept]. Start with the basics, use one example, then ask me a question to check my understanding."
- Students answer the AI's question and ask for correction.
- They request a new explanation using an analogy connected to something they enjoy.

Wow extension: Have AI create a three-question mini-quiz, grade the student's answers, and recommend the next study move.

Debrief: How did it feel to practice privately? What made the AI's feedback useful or not useful?

4. Question Storm | Comfort

Time: 30-40 minutes **Core skill:** Turning curiosity into investigable questions

Materials: Sticky notes or digital board

Goal: Students learn that strong AI work often begins with better questions.

Classroom moves

- The class chooses a broad theme such as music, climate, fashion, space, sports, health, or games.
- Students ask AI for 20 curious questions about the theme for beginners.
- They sort questions into categories: factual, creative, personal, ethical, technical, and debatable.
- Each student rewrites one question to make it more specific and more interesting.

Wow extension: Ask AI to rank the revised questions by research potential and explain the ranking.

Debrief: Which questions made you want to keep working? What makes a question too broad?

5. Everyday Task Transformer | Comfort

Time: 30 minutes **Core skill:** Using AI for practical planning

Materials: Student notebooks or devices

Goal: Students discover that AI can turn vague intentions into usable plans.

Classroom moves

- Students choose an everyday task: studying, cleaning a backpack, practicing an instrument, preparing for tryouts, or planning a weekend project.
- They ask AI to turn the task into a realistic checklist with time estimates.
- They revise the prompt so the plan fits their real schedule, energy level, and constraints.
- Students mark which steps they would actually do and which are unrealistic.

Wow extension: Ask AI to convert the checklist into a calendar plan, reminder script, or parent-friendly explanation.

Debrief: What did the AI assume about you? How did adding personal constraints improve the output?

6. Explain It Five Ways | Comfort

Time: 35 minutes **Core skill:** Requesting multiple representations

Materials: Class topic, AI tool

Goal: Students see that one idea can become many learning formats.

Classroom moves

- Choose a concept from class: fractions, ecosystems, theme, migration, gravity, or media literacy.
- Students prompt AI to explain it as a plain explanation, analogy, story, step-by-step guide, and quiz.
- They rate which version helped them most and why.
- Groups combine the strongest parts into one improved learning resource.

Wow extension: Ask AI to create a teacher-ready mini-lesson that uses all five formats in sequence.

Debrief: Which format helped memory? Which format helped understanding? Are those always the same?

7. Common Topic Prompt Tournament | Prompt Craft

Time: 60-90 minutes **Core skill:** Prompt comparison, scoring, and iteration

Materials: Shared topic, AI tool, scoring rubric

Goal: Students learn that prompts can be evaluated rigorously and improved deliberately.

Classroom moves

- The class agrees on one common topic of interest, such as sleep, sneakers, video games, local history, fast food, basketball, or ocean animals.
- Individually, students write prompts intended to produce the best package of pedagogically useful information on that topic.
- Students submit prompts, not names, into a capable AI and ask it to score them for clarity, audience fit, constraints, usefulness, and originality.
- The AI identifies strengths, weaknesses, and likely output problems. Students discuss what the scores reveal about prompting.
- Then students ask AI to generate stronger prompts for the same topic and compare human and AI-generated versions.

Wow extension: Move from a general text answer to a finished product: a PDF explainer, simple website outline, slide deck, interactive quiz, or classroom poster copy.

Debrief: What did the best prompts have in common? What did AI notice that humans missed? What did humans value that AI did not?

8. The Constraint Game | Prompt Craft

Time: 30-45 minutes **Core skill:** Controlling outputs with limits

Materials: Constraint cards or shared list

Goal: Students learn that constraints can make AI more useful, creative, and precise.

Classroom moves

- Give every group the same topic and a different constraint card: 100 words, no jargon, table only, humorous tone, three examples, no bullet points, or include counterarguments.
- Groups run their constrained prompt and paste the result into a shared space.
- The class guesses which constraint shaped each result.
- Students revise one output by adding a second constraint.

Wow extension: Challenge groups to create the most useful one-page beginner guide using exactly five constraints.

Debrief: When did constraints improve quality? When did they make the task worse?

9. Persona Lens Lab | Prompt Craft

Time: 40 minutes **Core skill:** Using roles and perspectives carefully

Materials: Topic list, role list

Goal: Students explore how assigned roles change AI's choices, vocabulary, and priorities.

Classroom moves

- Choose one topic with many possible lenses, such as school lunches, electric cars, social media, fashion, or a historical event.
- Groups ask AI to explain the topic as a scientist, historian, artist, coach, journalist, parent, and student.
- Students identify what each persona emphasized, ignored, or oversimplified.
- They build a final prompt that requests multiple perspectives without pretending any one role is neutral.

Wow extension: Ask AI to create a roundtable conversation among the personas, with each speaker challenging another speaker's assumptions.

Debrief: How can role prompts help? How can they create false authority?

10. Format Switchboard | Prompt Craft

Time: 45 minutes **Core skill:** Transforming information into useful formats

Materials: A short article, textbook section, or class notes

Goal: Students learn that format is part of thinking.

Classroom moves

- Provide a short chunk of content or have students generate a basic explanation on a topic.
- Students ask AI to transform it into a checklist, timeline, FAQ, comparison table, flashcards, and practice quiz.
- They evaluate which format fits which purpose: studying, teaching, deciding, remembering, or presenting.
- Each group chooses the best format and improves it for a real audience.

Wow extension: Create a classroom resource bundle with three formats for the same topic and a note explaining when to use each one.

Debrief: What information became clearer when the format changed? What got lost?

11. Bad Prompt Rescue | Prompt Craft

Time: 35 minutes **Core skill:** Diagnosing weak instructions

Materials: A set of intentionally vague prompts

Goal: Students practice naming prompt problems before trying to fix them.

Classroom moves

- Give students weak prompts such as "Tell me about history," "Make it good," or "Help with my project."
- Students label each problem: unclear goal, missing audience, no constraints, no format, too broad, or impossible to judge.
- They rewrite the prompt using the class rubric.
- Groups test original and revised prompts side by side.

Wow extension: Ask AI to act as a strict prompt coach and explain exactly why each revision improved the likely output.

Debrief: Which missing detail was most damaging? How did you know the rescue worked?

12. The Iteration Ladder | Prompt Craft

Time: 45-60 minutes **Core skill:** Improving through multiple rounds

Materials: AI chat history export or notes

Goal: Students experience AI work as a loop: prompt, inspect, revise, test, refine.

Classroom moves

- Students begin with a useful but imperfect prompt on a class topic.
- They make five planned revisions: clarify the goal, define the audience, add examples, set quality criteria, and request a final format.
- After each AI response, students write one sentence explaining what improved.
- They submit the first prompt, final prompt, and a short reflection.

Wow extension: Ask AI to summarize the student's own improvement process and turn it into a personal prompting checklist.

Debrief: Which revision had the biggest effect? Why is the first answer rarely the final product?

13. Fact-Check Relay | Judgment

Time: 50-70 minutes **Core skill:** Verification and source awareness

Materials: AI tool, approved research sources

Goal: Students learn that fluent text still needs evidence.

Classroom moves

- Students ask AI for a short explanation of a factual topic and require five specific claims.
- Each student highlights the claims and passes them to a partner.
- The partner checks each claim using approved sources and marks it verified, uncertain, misleading, or false.
- Students revise the AI output to include only verified claims and cite where they checked.

Wow extension: Ask AI to generate a verification plan before fact-checking, then compare the AI's plan to the class process.

Debrief: Did the AI sound confident when it should not have? What makes a claim checkable?

14. Bias and Missing Voices | Judgment

Time: 45-60 minutes **Core skill:** Identifying omissions and framing

Materials: Topic with social, historical, or cultural dimensions

Goal: Students notice that AI outputs can reflect partial perspectives.

Classroom moves

- Students ask AI for a neutral overview of a topic such as city planning, school uniforms, immigration, sports funding, or technology access.
- They mark whose interests are centered and whose are missing.
- They prompt AI to identify missing stakeholders, possible biases, and questions the first answer did not address.
- Students write a more balanced prompt and compare outputs.

Wow extension: Create a stakeholder map showing how different groups might define the problem differently.

Debrief: What does "neutral" mean in an AI answer? Who has to decide whether an answer is fair?

15. Hallucination Hunt | Judgment

Time: 35-50 minutes **Core skill:** Recognizing fabricated or uncertain information

Materials: Teacher-selected prompts with safe verification paths

Goal: Students learn that AI can invent details and that uncertainty is part of responsible use.

Classroom moves

- Choose topics where details are easy to verify, such as fictional book facts, local history, obscure records, or made-up product names.
- Students ask AI for confident answers and record any suspicious details.
- They verify details and classify errors: invented source, wrong date, wrong name, overgeneralization, or unsupported claim.
- Students rewrite the prompt to require uncertainty labels and source-checking steps.

Wow extension: Ask AI to produce a corrected answer with confidence levels for each claim, then audit those confidence levels.

Debrief: Why is confident language persuasive? What prompt language encouraged caution?

16. Debate Coach With Two Sides | Judgment

Time: 50-75 minutes **Core skill:** Argument analysis and counterargument

Materials: Debatable class question

Goal: Students use AI to strengthen reasoning without outsourcing judgment.

Classroom moves

- Pairs choose a debatable question with more than one reasonable side.
- They ask AI to build arguments for Side A and Side B, each with evidence needs and possible weak points.
- Students mark which points are strong, weak, unsupported, or emotionally persuasive.
- Pairs prepare a short debate using only the arguments they can explain in their own words.

Wow extension: Use AI as a cross-examiner that asks each side three tough questions after the debate.

Debrief: Did AI make either side sound stronger than it deserved? How did you decide what to keep?

17. Rubric Builder | Judgment

Time: 45 minutes **Core skill:** Defining quality criteria

Materials: A current assignment or project type

Goal: Students learn that quality has dimensions that can be named, discussed, and revised.

Classroom moves

- Students describe a task, such as a paragraph, poster, presentation, lab report, or video.
- They ask AI to draft a four-level rubric for the task.
- Students critique the rubric: What is vague? What is missing? What would be unfair?
- Groups revise the rubric and test it on a sample piece of work.

Wow extension: Ask AI to generate three sample submissions at different quality levels, then have students score them and defend their scores.

Debrief: How did the rubric change the way you understood the assignment?

18. Feedback Without Panic | Judgment

Time: 40-60 minutes **Core skill:** Using AI for revision feedback

Materials: Student draft without private information

Goal: Students practice receiving feedback as information, not judgment.

Classroom moves

- Students choose a short draft or paragraph and remove names or private details.
- They ask AI for feedback using a kind but rigorous teacher voice: two strengths, two priorities, and one concrete next step.
- Students compare AI feedback with peer feedback and identify overlap.
- They revise one sentence or paragraph based on feedback they choose to trust.

Wow extension: Ask AI to create a personalized revision checklist from the draft, then use it for a second revision pass.

Debrief: Which feedback felt useful? Which feedback was too generic? Who remains responsible for the final choices?

19. Classroom Museum Label | Creation

Time: 45-60 minutes **Core skill:** Condensing and presenting information

Materials: Objects, images, concepts, or artifacts

Goal: Students turn ordinary classroom material into public-facing explanation.

Classroom moves

- Each student chooses an object, image, quotation, formula, map, tool, or idea from class.
- They ask AI to draft a museum label for a general audience in 80-120 words.
- Students revise for accuracy, voice, and curiosity.
- They add an audio-tour script, question for visitors, or image-generation prompt if appropriate.

Wow extension: Create a mini classroom exhibition with QR codes linking to audio scripts or digital labels.

Debrief: How did the audience change the writing? What makes a short explanation powerful?

20. Micro Documentary Kit | Creation

Time: 60-90 minutes **Core skill:** Planning multimedia storytelling

Materials: Recording device optional, AI tool

Goal: Students see how AI can organize creative production without replacing their voice.

Classroom moves

- Groups choose a topic that can be explained in two minutes.
- They ask AI for a documentary plan: hook, interview questions, scene list, narration, and closing question.
- Students revise the plan to match what they can actually film, draw, photograph, or present.
- Groups produce a script, storyboard, or short recording.

Wow extension: Ask AI to create three alternate documentary styles: investigative, playful, emotional, and news-style. Students choose the best fit.

Debrief: What did AI help organize? Where did human judgment and taste matter most?

21. Interactive Study Guide | Creation

Time: 60 minutes **Core skill:** Building adaptive review materials

Materials: Review topic and AI tool

Goal: Students transform study content into an interactive learning experience.

Classroom moves

- Students choose a unit topic and ask AI to create a ten-question branching review quiz.
- Each answer choice should trigger feedback and a next step: easier question, harder question, hint, or explanation.
- Students test the quiz with a partner and mark confusing questions.
- They revise the quiz so wrong answers teach rather than shame.

Wow extension: Ask AI to convert the branching quiz into copy for a simple website, slide deck, or chatbot-style script.

Debrief: How is an interactive guide different from a worksheet? What makes feedback helpful?

22. Data Story From Scratch | Creation

Time: 70-100 minutes **Core skill:** Collecting, analyzing, and explaining data

Materials: Short class survey, spreadsheet optional

Goal: Students use AI to turn small data into a responsible story.

Classroom moves

- The class designs a quick survey with safe, non-private questions.
- Students collect anonymous totals and enter them into a table.
- They ask AI to identify patterns, possible charts, and cautious conclusions.
- Students write a data story that includes at least one limitation.

Wow extension: Ask AI to produce an infographic outline, including title, chart labels, key takeaway, and a warning against overclaiming.

Debrief: What can small data show? What can it not show?

23. Local Problem Pitch | Creation

Time: 75-120 minutes **Core skill:** Problem solving and proposal design

Materials: School or community issue list

Goal: Students use AI to think through solutions, stakeholders, risks, and tradeoffs.

Classroom moves

- Groups identify a real school or community problem they care about.
- They ask AI to create a stakeholder map, causes, possible solutions, and questions to investigate.
- Students choose one solution and prompt AI for a one-page proposal with benefits, risks, resources, and first steps.
- Groups revise the proposal based on what they know locally.

Wow extension: Create a pitch deck, flyer, email to a decision-maker, or prototype plan from the same proposal.

Debrief: What did AI know generally? What did only your class know locally?

24. Translation and Accessibility Lab | Creation

Time: 45-60 minutes **Core skill:** Adapting communication for access

Materials: A teacher-provided text

Goal: Students learn that AI can help include more readers when guided thoughtfully.

Classroom moves

- Provide a dense paragraph, announcement, or short lesson text.
- Students ask AI to adapt it for a younger reader, multilingual family, audio script, and visual learner.
- Students check whether meaning stayed accurate and respectful.
- They revise one version to be clearer, warmer, and more useful.

Wow extension: Create a communication kit: plain-language version, translated draft for human review, audio narration script, and image prompt.

Debrief: What is the difference between simplifying and dumbing down? Why does human review matter for translation?

25. Personal Learning Coach Simulation | Wow Build

Time: 45-60 minutes **Core skill:** Personalized planning with critique

Materials: Student-selected learning goal

Goal: Students see AI personalization as a draft to evaluate, not a command to obey.

Classroom moves

- Students choose a learning goal for the next week: vocabulary, typing, fitness, reading, coding, art, or test review.
- They describe available time, current level, resources, obstacles, and motivation.
- AI creates a seven-day plan with checkpoints and encouragement.
- Students critique the plan for realism and revise it into something they would actually try.

Wow extension: Ask AI to become a daily coach that checks progress, adjusts the plan, and celebrates evidence of effort.

Debrief: What made the plan feel personal? What did AI still not know about your real life?

26. No-Code Website Blueprint | Wow Build

Time: 75-120 minutes **Core skill:** Turning knowledge into a web experience

Materials: AI tool and optional simple website builder

Goal: Students move from text output to a structured digital product.

Classroom moves

- Students choose a topic worth teaching to others.
- They ask AI for a simple website plan: audience, pages, section headings, visual ideas, and calls to action.
- They prompt AI to write concise page copy and a navigation structure.
- If tools allow, students use a website builder or simple HTML template to assemble a prototype.

Wow extension: Ask AI to add an interactive element: quiz, decision tree, calculator idea, glossary filter, or choose-your-path guide.

Debrief: How did the product change when the audience became a website visitor rather than a teacher?

27. AI Tool Chain Challenge | Wow Build

Time: 60-90 minutes **Core skill:** Chaining outputs across formats

Materials: AI tool, design or presentation tool optional

Goal: Students experience AI as part of a production pipeline.

Classroom moves

- Groups choose one idea, message, or lesson.
- They generate a clear source explanation and verify it.
- They transform the source into five products: article, poster copy, podcast script, quiz, and slide outline.
- Groups evaluate which transformation best serves the audience and improve it.

Wow extension: Ask AI to create a consistent campaign theme, tagline, and style guide for all five products.

Debrief: Which outputs were easiest to transform? How did consistency help or hurt creativity?

28. Socratic Seminar With AI Observer | Wow Build

Time: 60-80 minutes **Core skill:** Analyzing discussion quality

Materials: Discussion notes, not student names

Goal: Students use AI to reflect on a real conversation while protecting privacy.

Classroom moves

- Hold a short seminar on a rich question.
- A student note-taker records themes, claims, evidence, questions, and moments of disagreement without names.
- The class gives the anonymized notes to AI and asks for themes, missing questions, strongest evidence, and next discussion moves.
- Students compare the AI analysis with their own experience of the conversation.

Wow extension: Ask AI to create a follow-up seminar plan that deepens the discussion and includes quieter voices.

Debrief: What can AI notice from notes? What can it not notice about tone, courage, or classroom context?

29. Mini App Design Sprint | Wow Build

Time: 90-150 minutes **Core skill:** Design thinking and prototyping

Materials: AI tool, paper prototyping materials, optional coding tool

Goal: Students discover that AI can help turn a need into a prototype plan.

Classroom moves

- Groups identify a small classroom problem: tracking assignments, choosing groups, practicing vocab, planning projects, or managing study time.
- They ask AI for user stories, essential features, screens, and a simple workflow.
- Students sketch the app and ask AI to critique the design for a beginner user.
- If appropriate, AI can draft simple code or no-code setup instructions for a prototype.

Wow extension: Run a usability test: one group uses another group's prototype while AI-generated criteria guide the observation.

Debrief: How did AI help you think like a designer? What did testing reveal that prompting alone could not?

30. From Question to Public Product | Wow Build

Time: 2-4 class periods **Core skill:** Capstone inquiry and publication

Materials: Research sources, AI tool, presentation or publishing tool

Goal: Students combine prompting, verification, revision, creation, and reflection into one finished artifact.

Classroom moves

- Students begin with a question they genuinely care about.
- They build a research prompt, verify key claims, and revise the prompt based on what they learn.
- They create a final product for a real audience: PDF guide, website, slide deck, video plan, interactive quiz, podcast script, or proposal.
- They include a process note showing their first prompt, best prompt, verification steps, and final human decisions.

Wow extension: Hold a gallery walk where students present not only the product but the AI collaboration path that got them there.

Debrief: What can AI amplify when a human has a real question, clear standards, and responsibility for the final result?

Teacher Closing Moves

A beginner AI classroom becomes powerful when students can name what changed between their first attempt and their final product. End major activities by asking students to show their process, not only the output.

Exit Ticket Options

- My first prompt was weak because...
- The revision that helped most was...
- One AI claim I verified or questioned was...
- One choice I made that the AI could not make for me was...
- Next time, I will prompt more clearly by...

Simple Student Reflection

In five sentences, explain what you asked AI to do, how you improved your prompt, what you checked, what you changed by human judgment, and what your final product helps someone understand or do.
